

Progress Log

Achievements

- Achieved milestones of displaying all of our concepts into the UI
- Successfully created Google Authentication for users
- Used mapbox to make this a cohesive app to plan paths
- Integrated bluebikes (building a locator)

Things we still want to add:

- Installing a notifications system
- Ability to add images to marks
- Being able to add a how to use this app or something to allow a better user onboarding
- Incorporate Daniel's feedback by removing lat and long points, etc.

Challenges:

- Server was crashing all the time,
- There weren't many Mapbox frontend libraries in vue// maybe because it's relatively new

This resulted in using the start and end points, we decided to use that format instead of arrows

-

Things we want to discuss:

DNJ - “A lovely clean map interface and a very impressive design of filters etc — looks very professional. I wouldn’t bother showing lat/long: what can the user do with that? My main concern is whether issues are associated with points or segments — or maybe both? And can you show issues along a route or only in a general area?”

- In light of DNJ’s comments, and since you came up with the bluebikes idea, what do you think of the way we are addressing the problem? Because we took one or two lines from the idea and decided to build on it.
 - DNJ concerned with how things are presented?
 -
- For a user
 - It has a good purpose, users might have value from it
 - It’s also intuitive
 - 1 small detail, dragging point -> (maybe do something along that), maybe use pins, with stuff along the map.
 - Start, end with icons S, E respectively
 - A couple of consistency things
 -
- Are there any points of improvement that you would like us to work on?
 - How easy was it for you to use our app and understand what was going on?

What should pitch consist of if we don’t want to repeat ourselves?

- Less technical, 2 minutes bc want to fit everyone
- Tie into compelling message
- Go out on creative try and marketing
- Skit -> oh no ran into a pothole what do u do? Have u tried this app
- Movie trailer
- Just need demo and compelling reasons for why u created it
